Public Interest Energy Research (PIER)

California Institute for Energy & Environment (CIEE)

California energy research related to data centers

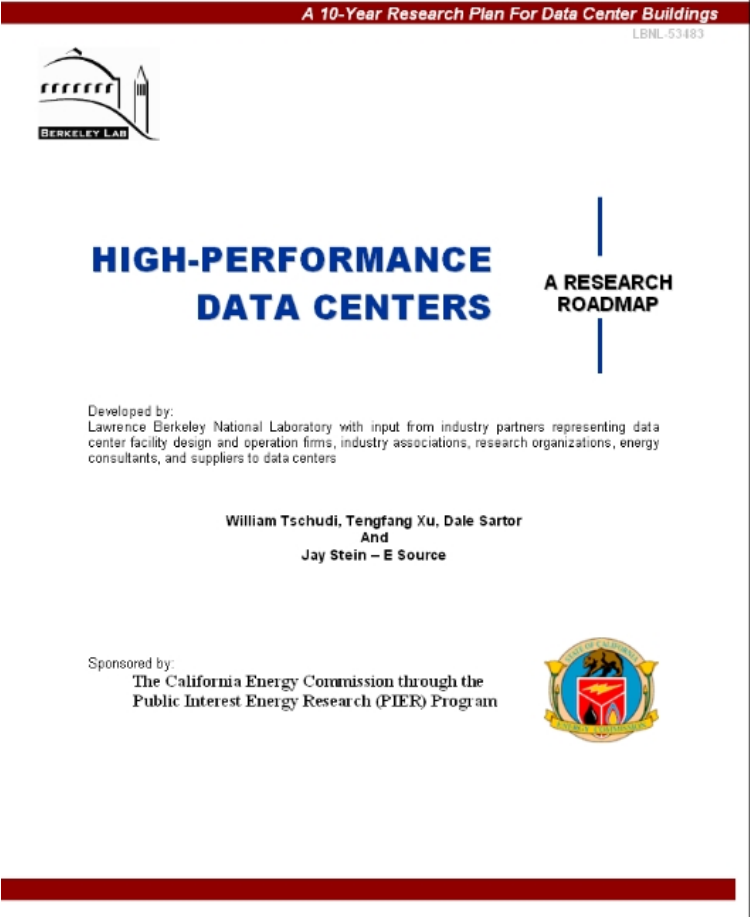

- ❖ Energy research roadmap
- ❖ Case studies and energy benchmarking
- ❖ Best practice identification
- ❖ Self benchmarking protocol
- ❖ Investigate efficiency of IT power supplies
- ❖ Investigate efficiency of UPS systems
- ❖ Metrics for computing performance vs. energy
- ❖ Technology transfer
- ❖ Demonstration projects

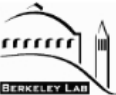

Efficiency Ideas

Many areas for potential efficiency improvement are suggested in the research roadmap – available here:

<http://datacenters.lbl.gov/docs/RoadmapFinal.pdf>

A 10-Year Research Plan For Data Center Buildings
LBNL-53483

HIGH-PERFORMANCE DATA CENTERS

A RESEARCH ROADMAP

Developed by:
Lawrence Berkeley National Laboratory with input from industry partners representing data center facility design and operation firms, industry associations, research organizations, energy consultants, and suppliers to data centers

**William Tschudi, Tengfang Xu, Dale Sartor
And
Jay Stein – E Source**

Sponsored by:
**The California Energy Commission through the
Public Interest Energy Research (PIER) Program**

Current PIER data center & IT equipment activities

- ❖ Benchmarking and Best Practices identification
 - Research-directed benchmarking
 - Self-benchmarking protocol
 - Summary of best practices observed
- ❖ Improve uninterruptible power supplies (UPS)
- ❖ Develop performance metrics
- ❖ Improve power supplies in IT equipment

Preliminary findings:

- ❖ Infrastructure is typically oversized by factors of 4 or more for today's loads
- ❖ Heat intensity is rising however computing capability is rising faster
- ❖ There is wide variation in intensity and efficiency
- ❖ Well studied efficiency measures (chilled water optimization, lighting controls, etc.) are not implemented
- ❖ Controversy over use of some technologies
- ❖ Industry is concerned – but more for ability to cool rising heat intensity – not efficiency

High-tech demonstration projects

- ❖ LBNL scoped 15 potential demonstrations
- ❖ 5 demonstrations were selected including DC powering rack of computers

DC Power Demonstration Project Team

LBNL

- Bill Tschudi (PI)
- Dale Sartor
- Evan Mills
- Steve Greenberg

Subcontractors

- Ecos Consulting/EPRI Solutions (Power Supply and UPS evaluations)

Industry partners

- EYP Mission Critical Facilities (Data center benchmarking data collection)
- TBD - Cost sharing required

New additions to the project:

- ❖ DC powering rack of computers (why we are here)
- ❖ Design process – issues in planning a supercomputer center
- ❖ One year schedule

Wide range of efficiencies:

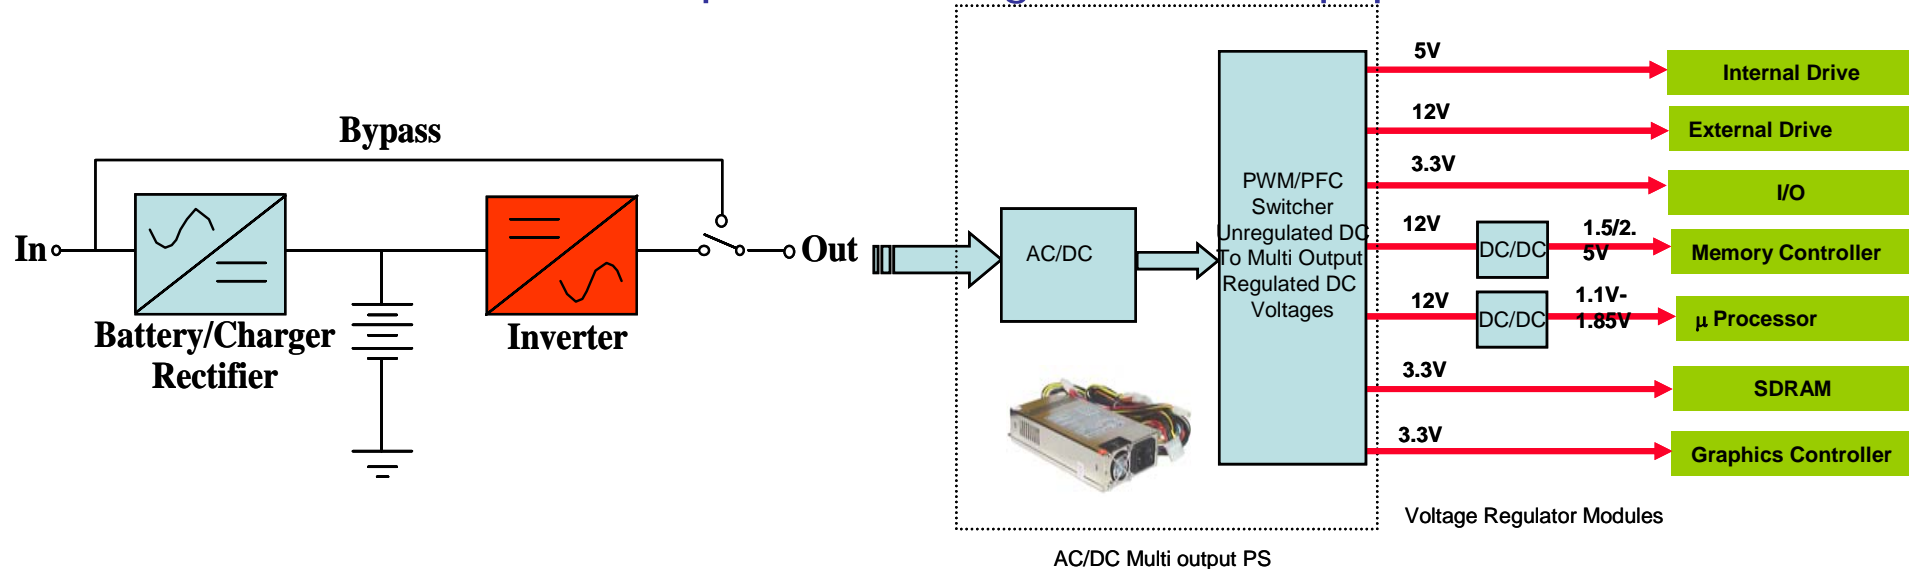

HVAC effectiveness varies →

The opportunity: power conversion

The loss in electrical power through conversion of AC to DC to AC to DC occurs for all power flowing to the IT equipment.

Efficiency gains have a magnifying effect by reducing need for HVAC (e.g. 10% saving at the UPS level could mean 20% saving for the datacenter)

UPS measured efficiency

Typical operating range 30-50%

Double conversion efficiency ranged from 86% to 97% at peak load, but efficiency under typical operating loads ranges from 81% to 93%

High-Performance Buildings for High-Tech Industries

Power Supply Findings:

Typical operating range is 30%-50% to provide redundancy

20% variation in worst to best

Today's goal:

Help us define demonstration project

Identify Industry partner roles and resources

Identify barriers and plans to overcome them

Clear action plan
